

## Solutions for HW # 20

Problem 1:

According to the footnote in Jackson, the delta function in the coordinate system  $(x_1, x_2, x_3)$  is related to the coordinate system  $(\xi_1, \xi_2, \xi_3)$  by the following relation:

$$\delta(x_1 - x_1') \delta(x_2 - x_2') \delta(x_3 - x_3') = \frac{1}{|J(x_i, \xi_i)|} \delta(\xi_1 - \xi_1') \delta(\xi_2 - \xi_2') \delta(\xi_3 - \xi_3'), \quad (1)$$

where

$$J(x_i, \xi_i) = \begin{pmatrix} \frac{\partial x_1}{\partial \xi_1} & \frac{\partial x_1}{\partial \xi_2} & \frac{\partial x_1}{\partial \xi_3} \\ \frac{\partial x_2}{\partial \xi_1} & \frac{\partial x_2}{\partial \xi_2} & \frac{\partial x_2}{\partial \xi_3} \\ \frac{\partial x_3}{\partial \xi_1} & \frac{\partial x_3}{\partial \xi_2} & \frac{\partial x_3}{\partial \xi_3} \end{pmatrix}, \quad (2)$$

is the Jacobian,  $(x_1', x_2', x_3')$  and  $(\xi_1', \xi_2', \xi_3')$  are coordinates of the singular point at the two systems respectively. The cylindrical coordinate system  $(x, y, z)$  is related to the Cartesian coordinate system  $(r, \theta, z)$  by

$$\begin{aligned} x &= r \cos \theta \\ y &= r \sin \theta \\ z &= z \end{aligned} \quad (3)$$

Inserting eq. (3) into eq. (2) yields

$$J = \begin{pmatrix} \cos \theta & -r \sin \theta & 0 \\ \sin \theta & r \cos \theta & 0 \\ 0 & 0 & 1 \end{pmatrix}, \quad (4)$$

and hence eq. (1) becomes

$$\delta(x - x_0) \delta(y - y_0) \delta(z - z_0) = \frac{1}{r} \delta(r - r_0) \delta(\theta - \theta_0) \delta(z - z_0). \quad (5)$$

Without losing generality, we can pick the Cartesian coordinates system such that, for an electron moving along z axis, its trajectory is given by

$$\begin{aligned}
x_0 &= a \\
y_0 &= 0 \text{ ,} \\
z_0 &= vt
\end{aligned}
\tag{6}$$

and consequently, its charge density is given by inserting eq. (6) into eq. (5):

$$\rho(\vec{x}) = Q\delta(\vec{x}) = Q\frac{1}{r}\delta(r-a)\delta(\theta)\delta(z-vt).
\tag{7}$$

As the cylindrical coordinate is not uniquely defined with respect to the azimuthal angle  $\theta$ , we can write eq. (7) into the following form

$$\rho(r, \theta, z) = Q\frac{1}{r}\delta(r-a)\delta(z-vt)\sum_{n=-\infty}^{\infty}\delta(\theta-2n\pi).
\tag{8}$$

Eq. (8) suggests that  $\rho(r, \theta, z)$  is a periodic even function in  $\theta$  with a period of  $2\pi$  and hence it can be expressed as a summation of its Fourier components:

$$\rho(r, \theta, z) = Q\frac{1}{r}\delta(r-a)\delta(z-vt)\sum_{k=-\infty}^{\infty}a_k\exp(ik\theta)
\tag{9}$$

where

$$a_k = \frac{1}{2\pi}\int_{-\pi}^{\pi}\sum_{n=-\infty}^{\infty}\delta(\theta-2\pi n)\exp(-ik\theta)d\theta = \frac{1}{2\pi}.
\tag{10}$$

Inserting eq. (10) into eq. (9) yields

$$\begin{aligned}
\rho(r, \theta, z) &= Q\frac{1}{\pi r}\delta(r-a)\delta(z-vt)\left\{\frac{1}{2} + \sum_{m=1}^{\infty}\cos(m\theta)\right\} \\
&= Q\frac{1}{\pi r}\delta(r-a)\delta(z-vt)\frac{1}{1+\delta_{m,0}}\sum_{m=0}^{\infty}\cos(m\theta), \\
&= \sum_{m=0}^{\infty}\frac{Q_m\cos(m\theta)}{\pi a^{m+1}(1+\delta_{m,0})}\delta(r-a)\delta(z-vt)
\end{aligned}
\tag{11}$$

where for the last step, we used the fact that  $\delta(r-a)$  implies that  $r$  always take value at  $a$ .

Problem 2:

Figure 1: Integration contour in complex  $\omega'$  plane.

From Cauchy residue theorem, the contour integral can be calculated as

$$\int_C \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' = 2\pi i Z_{//}(\omega) . \quad (12)$$

The LHS of (12) can be split into the following form

$$\begin{aligned} \int_C \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' &= \int_{C_1} \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' + \int_{C_2} \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' + \int_{C_3} \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' \\ &= P.V. \int_{-\infty}^{\infty} \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' + 0 + \int_{e^{i\pi}}^{e^{i2\pi}} \frac{Z_{//}(\omega)}{e^{i\theta}} de^{i\theta} , \quad (13) \\ &= P.V. \int_{-\infty}^{\infty} \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' + 0 + i\pi Z_{//}(\omega) \end{aligned}$$

where the integral along  $C_2$  vanishes since we assume  $Z_{//}(\omega')$  is well behaved at large  $|\omega'|$ . From eq. (12) and (13), it follows

$$Z_{//}(\omega) = -\frac{i}{\pi} P.V. \int_{-\infty}^{\infty} \frac{Z_{//}(\omega')}{\omega' - \omega} d\omega' . \quad (14)$$

Splitting eq. (14) into the real and imaginary part leads to

$$\operatorname{Re}[Z_{//}(\omega)] = \frac{1}{\pi} P.V. \int_{-\infty}^{\infty} \frac{\operatorname{Im}[Z_{//}(\omega')]}{\omega' - \omega} d\omega' , \quad (15)$$

and

$$\operatorname{Im}[Z_{//}(\omega)] = -\frac{1}{\pi} P.V. \int_{-\infty}^{\infty} \frac{\operatorname{Re}[Z_{//}(\omega')]}{\omega' - \omega} d\omega' . \quad (16)$$
